No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                       A_Geneseq_19Jun03:*

                                                                                                                                                                                        ò
                                          The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for requiating or controlling dehiscence of a pod or an anther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter delayed plants such as oilseed rape (Brassica napus). The present sequence represents a B. napus response regulator protein D22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod or an anther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter-delayed plants such as oilseed rape (Brassica napus). The present sequence represents a D22 A. thaliana homologue D22AT3 putative peptide sequence.

The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod or an anther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter delayed plants such as oilseed rape (Brassica napus). The present sequence represents the B. napus D22B putative peptide sequence.

```
AAA TAJ263 to AAA79736 and AAB25100 to AAB25570 represent polynucleotide
and protein sequences isolated from eucalyptus (Eucalyptus grandis) or
pine (Pinus radiata also known as Monterey pine). The protein sequences
are involved in cell signalling. The polynucleotide and protein
sequences can be used to modify the response of plant cells to external
sequences can be used to modify cell protein
sequences can be used to modify cell proliferation,
development of a plant. They can be used to modify cell proliferation,
development of a plant. They can be used to modify cell proliferation,
development of a plant. They can be used to modify cell proliferation,
attered fruit ripening and senescence of leaves and flowers e.g. to
altered fruit ripening and senescence of leaves and flowers e.g. to
delay senescence and prolong the life of cut flowers or enhance
senescence of reproductive organs to engineer sterile plants. Other
modifications can be used to delay senescence in selected cell types or
organs providing fruit and vegetables which have a longer shelf life
between harvest and consumption, or to decrease branching frequency in
consume the species giving long stretches of valuable knot-free clear
consumers and prolong the limber furniture and veneers.

The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod or an arther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter-delayed plants such as oilseed rape (Brassica napus). The present sequence represents the partial fragment of B. napus D22B protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RscC; antagonist; agonist; cytokinin receptor; receptor; signal transduction; histidine kinase; hormone; cell division; cell differentiation; agriculture; growth regulator; harvest.

```
The invention discloses a method for analysing antagonist or agonist activity to a cytokinin receptor. The method comprises bringing a candidate substance into contact with a transformed cell, in which a encoding the receptor has been introduced, and then measuring the existence, or the quantity, of the intracellular signal transduction from the receptor expressed in the cell. The cytokinin receptor comprises an extracellular region of the receptor, transmembrane regions, a histidine kinase region and a receiver region of the kinase. The transmembrane receptor regions and kinase region of the monogeneous to each other and the receptor region is heterogeneous to them. Cytokinins are plant hormones relevant to cell division and differentiation of higher plants. The method is used for analysing agonist or antagonist activity to a cytokine receptor. A substance with agonist or antagonist activity to the receptor can be used in agriculture, as a plant growth regulator, e.g. after harvest. The advantage is that the candidate substances do not need to be prepared in such large amounts as in previous methods and that the method avoids the immensely long time to observe and evaluate the growth of the plant candidate substances of the proparation of histidine kinase which can be resented is the E. coli receiver region of histidine kinase which can transmit signals to the cytokinin receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               18 VLIVDDDPLNLIHEKIIKAIGGISQTANNGEEAVIIHRDGGSSFDLILMDKEMPERDGV 77

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel isolated polypeptide comprising a PvrR (variant Pseudomonas) amino acid sequence having at least 50 % identity to a 399 residue amino acid sequence, given in the specification, where expression of the polypeptide, in a microorganism, affects phenotypemediated antibiotic resistance in the microorganism. The methods and compositions of the present invention are useful for the diagnosis, prevention and treatment of gram negative or gram-positive bacterial infection. This sequence represents a Pseudomonas protein used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated PurR polypeptide and polynucleotide that regulates bacterial biofilm formation, useful for the diagnosis, prevention and treatment of gram-negative or gram-positive bacterial infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           'n

Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: MARC J.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.13 6
CURENT APPLICATION NUMBER: US 60/074,788
PRIOR PELLING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR FILING DATE: 1998-07-18
PRIOR FILING DATE: 1998-07-18
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 26112

                                                                                                                                                                                                                                 A.Description: Wavely dentified genes involved in signal transduction of Escherichia col A.Reference number: J0020

A.Reference number: J0021

A.Accession: J0021

A.Accession: J0021

A.Residues: 1-151, F', 153-241, PL', 244-274, R', 276-419, FE', 422-738, D', 740-757, K', 759-8705 and 140, 73-77, 1994

A.Title: Newly identified genes involved in the signal transduction of Escherichia coli A.Accession: 14120

A.Accession: 14120

A.Status: preliminary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A. N.Alternate names: regulatory protein rcsC
C.Species: Escherichia coli
C.Species: Escherichia coli
C.Species: Escherichia coli
C.Species: Ascherichia coli
C.Species: Allore 1991 #sequence_revision 17-Oct-1997 #text_change 01-Mar-2002
C.Accession: H64991; JV0069; A48659

Science 277, 1453-1462, 1997
A.Title: The complete genome sequence of Escherichia coli K-12.
A.Reference number: A64720; MuID:97426617; PMID:9278503
A.Accession: H64991
A.Scatus: preliminary; nucleic acid sequence not shown; translation not shown
A.Molecule type: DNA
A.Residues: 1-933 CBLAT>
A.Cross-references: GB.AE00311; GB:U00096; NID:91788547; PIDN:AAC75278.1; PID:91788548;
A.Experimental source: strain K-12, substrain MG1655

Res. 8:11-22(2001).
FUNCTION: Member of the two-component regulatory system evgS/evg Phosphorylates evgA via a four-step phosphorelay in response to environmental signals (By similarity).
SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane

PTM: Activation probably requires a transfer of a phosphate group between a His in the transmitter domain and an Asp of the receiver domain (By similarity).
-! SIMILARITY: Contains 1 histidine kinase domain.
-! SIMILARITY: Contains 1 PAS (PER-ARNI-SIM) dimerization domain.
-! SIMILARITY: Contains 1 response regulatory domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Synthesis.";

J. Bacteriol. 178:1691-1698(1996).
-I- FUNCTION: Member of the two-component regulatory system rcsC/rcsB involved in the regulation of the expression of genes involved in colarity acid capsule synthesis. RcsC probably functions as a membrane associated protein kinase that phosphorylates rcsB in response to environmental signals.
-: SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MEDLINE-21534947; PubMed=11677608; Parkhill J., Dougan G., James K.D., Thomson N.R., Pickard D., Wain J Churcher C., Mungall K.L., Bentley S.D., Holden M.T.G., Sebaihia M., Banter S., Basham D., Brooks K., Chillingworth T., Connerton P., Cronin A., Davies R.M., Dowd L., White N., Farrar J., Cronin A., Davies R.M., Dowd L., White N., Farrar J., Feltwell T., Hamilin N., Haque A., Hien T.T., Holroyd S., Jagels K., Kroph A., Larsen T.S., Leather S., Moule S., O'Gaora P., Parry C., Whitehead S., Barrell B.G.; Simmonds M., Skelton J., Stevens K., Whitehead S., Barrell B.G.; anultiple drug resistant Salmonella enterica serovar Typhi CT18"; Mature 413:848-852(2001).

(Probable).
--- PTM: Activation probably requires a transfer of a phosphate group between a His in the transmitter domain and an Asp of the receiver domain (By similarity).
--- SIMILARITY: Contains 1 histidine kinase domain.
--- SIMILARITY: Contains 1 PAS (PER-ARMT-SIM) dimerization domain.
--- SIMILARITY: Contains 1 PAS (PER-ARMT-SIM) dimerization domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -i. PTM: Activation probably requires a transfer of a phosphate group between a His in the transmitter domain and an Asp of the receiver domain (By similarity).
-i. SIMILARITY: Contains I histidine kinase domain.
-i. SIMILARITY: Contains I PAS (PER-ARNT-SIM) dimerization domain.
-i. SIMILARITY: Contains I response regulatory domain.
-i. CAUTION: REF. 4 SEQUENCE DIFFERS FROM THAT SHOWN DUE TO A FRAMESHIFT IN POSITION 808.
